## **Embarcadero Technologies**

Kyle Hailey on http://dboptimizer.com:

"Most recently I worked at Embarcadero Technologies where I designed the first successful product the company has written internally and released in the last 10 years called DB Optimizer.

DB Optimizer was inspired by the successes and frustrations I had working on Oracle's EM 10g. In OEM 10g I worked on a complete redesign of the Oracle Enterprise Manager performance pages, shifting the screens away from confusing clutter to simple but powerful graphics based on wait time and a new metric session load (aka AAS – average active sessions). The successful redesign of OEM 10g has continued to be the foundation of OEM 11g"

After 5 ½ years Kyle left Embarcadero Technologies in October 2010 and works now as Performance Architect at Delphix. Before his stage at Embarcadero he worked in the Oracle Enterprise Manager 10g team along with John Beresniewicz, Graham Wood and Gaja Vaidyanatha.

# DB Optimizer XE Product Overview

### Major release 2010

	DB Optimizer XE Developer	DB Optimizer XE Pro	DB Optimizer XE Enterprise	DB Optimizer Professsional
Support for all database platforms included	х	X	x	Optional
Embarcadero ToolCloud	Х	Х	Х	Optional
InstantÖn™	Х	Х	Х	Optional
Centralized license management	Х	Х	Х	Optional
DB Optimizer 2.X core	Х	Х	Х	X
SQL Profiling	Х	Х	Х	X
Load Testing	X	Х	Х	Х
SQL Editor	Х	Х	Х	Х
Tuning: -Visual SQL Tuning -SQL Hint Analysis		x	x	х
Profiling into Repository (single data source)	•	x	x	х
24x7 Monitoring Server, DB Performance Center XE Client*		х	x	
24x7 Monitoring Server, DB Performance Center XE Server	•		x	

\*The DB Performance Center XE Client requires at least one DB Performance Center XE Server, which is part of DB Optimizer XE Enterprise

## **Functional Overview**

### ---

- Profiler
  - Visualize resource usage per average active session, SQL statements, events, sessions, object I/O
  - Life data capturing (fixed sampling interval of 1 second, configurable refresh interval)
  - Save captured data for offline analysis to flat file or database
- Tuner
  - Paste in SQL to be tuned or extract them from scripts, DB objects or SGA
  - Find faster plans using hints
  - Apply faster plans (stored outlines)
  - Index, statistics, outline analysis
  - Index advisor
  - Visual SQL Tuning (VST diagrams)
  - Explain plain incl. binds/user

- Load Tester
  - Run a chosen SQL in parallel
    - Define number of parallel sessions
    - Define number of executions or run time
    - Define execution delay
  - Monitor execution with Profiler
  - Compare original SQL with tuned variants within Profiler (time based identification)
- SQL Editor
  - Code assist (e.g. code completion)
  - Code formatter
  - Code corrections and transformations (quick fixes)

15.04.2011

- Introduction
- Installation
- Profiling
- (Visual) SQL Tuning
- Load Testing
- SQL IDE
- First Real World Experiences
- Conclusion

15.04.2011

### Installation

### . . .

- Packaged into a single-file (Eclipse Rich Client Application)
  - Embarcadero DB Optimizer XE for Windows (used for this evaluation)
  - Embarcadero DB Optimizer XE for Linux
  - Embarcadero DB Optimizer XE InstantOn for All-Access for Windows
- Runs without installation
- Argue that they do not change the OS-settings/registry (which is in fact not true)
- Licensing
  - Default: Named User bound on a Workstation (multiple installation on desktop and notebook are possible, but have to be approved by Embarcadero Technologies)
  - Other, more feasible network based licensing models available

15.04.2011 ©

# Privileges Needed on Target Database Instance

- For Profiling only
  - CREATE SESSION
  - SELECT\_CATALOG\_ROLE
- For Explain Plan

10

- CREATE TABLE (to create an explain plan table)
- Additional privileged depending on statement to be explained
- SQLTUNING role is recommended for full functionality (see next slide)

CREATE USER TUNINGUSER IDENTIFIED BY tuningpassword DEFAULT TABLESPACE USERS TEMPORARY TABLESPACE TEMP QUOTA UNLIMITED ON USERS PROFILE DEFAULT ACCOUNT UNLOCK;

GRANT SQLTUNING TO TUNINGUSER; ALTER USER TUNINGUSER DEFAULT ROLE SQLTUNING;

### **SQLTUNING ROLE – Privileges**

CREATE ROLE SQLTUNING NOT IDENTIFIED; GRANT SQLTUNING TO CONNECT; GRANT SQLTUNING TO SELECT CATALOG ROLE; GRANT ANALYZE ANY TO SQLTUNING; GRANT CREATE ANY OUTLINE TO SQLTUNING; GRANT CREATE ANY PROCEDURE TO SQLTUNING; GRANT CREATE ANY TABLE TO SQLTUNING; GRANT CREATE ANY TRIGGER TO SQLTUNING; GRANT CREATE ANY VIEW TO SQLTUNING; GRANT CREATE PROCEDURE TO SQLTUNING; GRANT CREATE SESSION TO SQLTUNING; GRANT CREATE TRIGGER TO SQLTUNING; GRANT CREATE VIEW TO SOLTUNING; GRANT DROP ANY OUTLINE TO SQLTUNING; GRANT DROP ANY PROCEDURE TO SQLTUNING; GRANT DROP ANY TRIGGER TO SQLTUNING; GRANT DROP ANY VIEW TO SQLTUNING; GRANT SELECT ON SYS.V \$SESSION TO SQLTUNING; GRANT SELECT ON SYS.V \$SESSTAT TO SQLTUNING; GRANT SELECT ON SYS.V \$SQL TO SQLTUNING; GRANT SELECT ON SYS.V \$STATNAME TO SQLTUNING;

# DBMS Support and System Requirements

### DBMS Support

- Oracle<sup>®</sup> 8i-11g
- Sybase<sup>®</sup> 12.5 15.0
- IBM<sup>®</sup> DB2<sup>®</sup> for LUW 8.0 9.0
- Microsoft<sup>®</sup> SQL Server 2000, 2005 and 2008

### System Requirements

- Microsoft Windows 2003, XP, Vista (32 bit), Red Hat Enterprise Linux 5.0 (32 bit), or SUSE Linux Enterprise Server 10 (32 bit)
- Sun Java 2 Standard Edition 5.0 Update 11 for Microsoft Windows or Linux: Sun Java 2 Standard Edition 5.0 Update 11 for Linux x86
- 1024 MB memory
- 500 MB disk space

## **Identify Tuning Candidates**

### ---

- Identify Tuning Candidates
  - Ad hoc SQL
  - Database Objects
  - SQL Files
  - Active SQL in SGA
- Option 1: Generate Alternative Statements (Brute Force Tuning Approach)
  - Find statements through hint injection
  - Find rewritten statements
  - Execute these statements (cancel execution after elapsed time of 150% of baseline)
  - Compare to baseline (original statement) to find "best" plan
  - Apply best plan using outline wizard
- Option 2: Detailed SQL Analysis
  - SQL Diagram
  - Index Analysis
  - Table Statistics
  - Column Statistics and Histograms
  - Outlines

## Tuner Option 1 – After Generating Cases

makes IT easier.

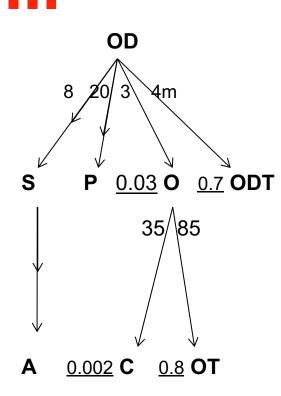

# Option 2 – SQL Diagram

- VST Visual SQL Tuning using SQL Diagram to
  - Faster understanding of the query
  - Display table relationships and sizes graphically
  - Detecting bottlenecks in the query execution plan easier
  - Similarities to SQL Diagram from Dan Tow
- Calculates the join ratio between tables and filter ratios
- Usage of selected object in SQL diagram is highlighted in SQL statement

15.04.2011 © 2011

## Diagramming SQL by Dan Tow-Method

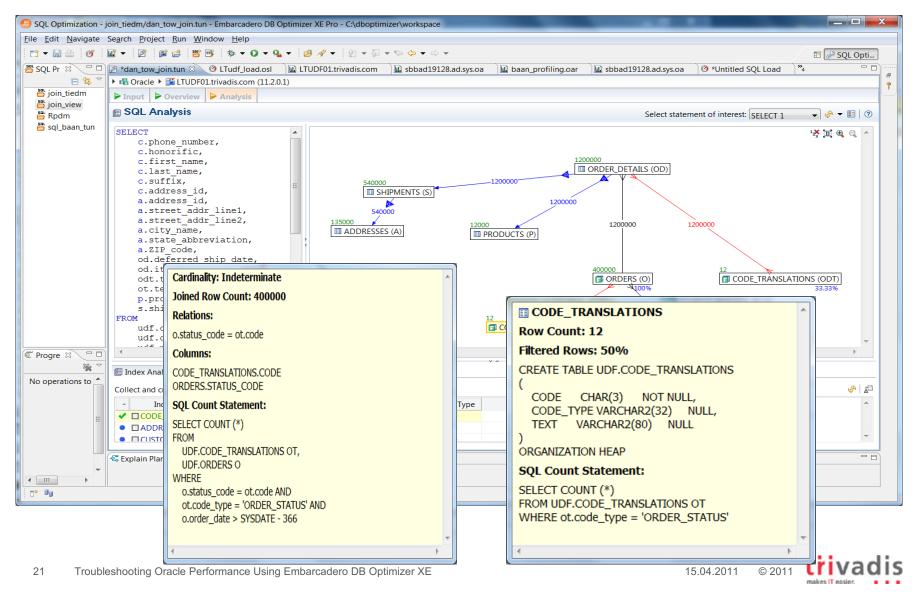

Optimal Join Order C,O,OT,OD,ODT,P,S,A SELECT ....

FROM Orders O, Order Details OD, Products P, Customers C, Shipments S, Addresses A, Code Translations ODT, Code Translations OT WHERE C.Last Name like :Last Name || '% ' AND C.First Name like :First Name || '% ' AND OD.Order ID = 0.Order ID AND O.Customer ID = C.Customer ID AND OD. Product ID = P.Product ID (+)AND OD.Shipment ID = S.Shipment ID (+) AND S.Address ID = A.Address ID (+) AND O.Status Code = OT.Code AND OT.Code Type = 'ORDER STATUS' AND OD.Status Code = ODT.Code AND ODT.Code Type = 'ORDER DETAIL STATUS' AND O.Order Date > :NOW -366 ORDER by C.Customer ID, O.Order ID Des;

## SQL Diagram With Ratios

### . . .

## SQL Analysis

### - - -

- Index analysis:
  - listing of used indexes,
  - not used indexes,
  - available indexes and
  - suggested indexes through different colours
- Highlight SQL rewrite suggestions to make sure that the result is not affected, eg. missing join (red –table)

Collect and create indexes

### SQL Editor

### . . .

- Code assist (e.g. code completion)
- Code formatter
- Code corrections and transformations (quick fixes, e.g. for Cartesian join)

```
SELECT ...
FROM
    udf.ttiedm110600 a,
    udf.ttiedm100600 b
WHERE
    b.t$eitm (+) = a.t$eitm AND
    b.t$revi (+) = a.t$revi AND
    (b.t$exdt > ' 04/03/2011
00:00:00') AND
    a.t$cmtp = 2 AND
    a.t$comp > 'TRVP065860000' AND
    b.t$indt <= '04/03/2011
23:59:00' AND
    b.t$rele = 1</pre>
```

```
SELECT ...
FROM
    udf.ttiedm110600 a,
    udf.ttiedm100600 b
WHERE
    b.t$eitm (+) = a.t$eitm AND
    b.t$revi (+) = a.t$revi AND
    (b.t$exdt (+) > ' 04/03/2011
00:00:00') AND
    a.t$cmtp = 2 AND
    a.t$cmtp > 'TRVP065860000' AND
    b.t$indt (+) <= '04/03/2011
23:59:00' AND
    b.t$rele (+) = 1</pre>
```

## SQL IDE – Fix Missing Outer Join

# DB Optimizer XE for a DWH of a Financial Institute

- "Optimizing Monthly Processing" (>30h)
- DB Optimizer XE was used as a secondary information source only (Profiling Analysis)
- The primary information source was a set of log files to get a better understanding of the contribution of the components to the end-to-end runtime of the overall processes (Runtime Log Analysis)
- Among the first question was about the overhead/load DB Optimizer XE is producing (see next slide)

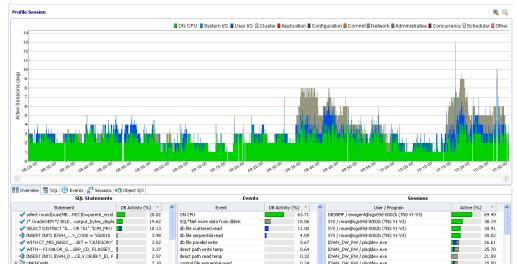

# What is the Profiling Overhead of DB Optimizer XE?

- Analysis of 10046 Trace file initiated by DB Optimizer XE profiler
  - 8 JDBC sessions created
  - A lot of dictionary queries are just executed once, generating insignificant load
  - Every second v\$session is queried (wait\_time != 0 AND status = 'ACTIVE')
  - Based on v\$session query result additional information is retrieved periodically and via a single query for multiple objects using in-lists, e.g. V\$SQL, V\$SYSTEM\_EVENT
- Overhead cannot be generally defined in a fixed percentage of the DB load, nonetheless, the load by DB Optimizer XE is considered to be very small and additional issues on the profiled database instance are not expected.

## **Profiling Analysis**

- The graph presents CPU usage as green values, other colors are considered bottlenecks.
- The goal is to identify top resource consumers for optimization.
- The application context of the SQL statement (e.g. PL/SQL unit, PowerCenter workflow, load process, etc.) is not known by the profiler.
- It is quite difficult to predict the impact of the optimization on runtime of the overall process, especially if processes are executed in parallel and enough system resources are available.

- E.g. disabling the Oracle Enterprise Manager activities in the above chart, which are in fact the top CPU resource consumers will reduce the runtime of the overall monthly process by 0 seconds, since enough CPU resources are available (and no other resources are consumed).
- Nonetheless the profiling results combined with application knowledge will potentially identify SQL statements on the critical path, where an optimization of the SQL statement will also reduce the runtime of the overall process.

# General Limitations on Data Accuracy

- DB Optimizer XE is sampling the Oracle V\$SESSION data (active sessions or sessions waiting for resources) every second.
- This means that short running SQL statements are usually missed a lot of times. However, short running, often executed statements should be recognized nonetheless, but the metric DB Activity (%) is typically reported too low. In these cases other V\$SQL based metrics will provide more accurate information.
- Generally speaking this tool is better suited to identify bottlenecks of long running statements than often executed short running statements.

## Instrumentation Bug 5928612

 The profiled database instances run on an Oracle Database Server version which has a known instrumentation bug. Here's the description of Oracle bug number 5928612:

If a job is run through DBMS\_JOB then the columns SQL\_ADDRESS, SQL\_ID and SQL\_HASH\_VALUE are not populated in V\$SESSION which can hinder performance monitoring. (the columns show as 0). A similar issue exists for DBMS\_SCHEDULER under <Bug:5140631>

- The bug should be fixed in the current 11g and 10gR2 releases.
- DB Optimizer XE very much depends on correct V\$SESSION entries as other tools like Oracle Enterprise Manager do.
- Since the major part of the daily loads are executed via ad-hoc DBMS\_JOB jobs this will certainly hinder performance monitoring. In fact the daily load currently cannot be profiled in a way to identify long-running statements using such a profiler.

## Findings Concerning DB Optimizer XE

- One instance of DB Optimizer XE may profile just one DB instance in parallel
- Starting multiple DB Optimizer XE instances requires multiple Eclipse workspaces
- Profiling of 6 DB instances in parallel were possible (for a short time) The longer a profiling session runs the more memory is needed.
- Saving files after an error was generally impossible (either an index out of bounds exception was raised or the save process was hanging)
- Errors occurred also without PC resource bottlenecks
- Long running profile results probably should be stored on a unrelated DB instance instead of local files (or the enterprise features should be considered) – to be verified
- Tuner could not be used because of restricted access rights, long parsing times, parsing errors

## Findings Based on Profiling Analysis

- Long-running statements (0.5h) joining several single row context tables
  - Confirms finding based on Runtime Log Analysis
  - Huge performance improvement through use of SYS\_CONTEXT proved by a test-case.
  - Expected performance improvement from 3h to less than 1h
- Long-running statement (1.2h) caused by an suboptimal plan
  - Oracle did not find a Hash join based plan because of various IN-Lists combinations
  - Rewrite of statement possible with application knowledge to allow the optimizer to find a hash join plan leads to major runtime improvement (less than 5 minutes)
- Periodical executed, I/O resource intensive status queries identified
- ALTER TABLESPACE ADD DATAFILE statements found during month end processing

- Introduction
- Installation
- Profiling
- (Visual) SQL Tuning
- Load Testing
- SQL IDE
- First Real World Experiences
- Conclusion

### Assessment

### . . .

### Pros

- Independent of Oracle version, edition and licensed options
- Easy to install
- Self-explanatory interface
- Profiler allows quick access to top resource consumers and related statements
- Good visualization of complex SQL statements (VST) incl. view expansion
- Faster SQL Tuning process regarding
  - Index analysis
  - Statistics validation
  - Load test and generating cases
- Explain plan supports binds (for standard types only) and parsing user

- Cons
  - Unsuccessful parse makes Tuner and SQL Editor unusable
  - Parser is sometimes really slow
  - Occasionally an inconsistent internal status avoids save to file (index out of bounds error, crashes, spins)
    - Profiler
    - Tuner
  - Plan visualization in other IDEs are better (e.g. execution sequence in SQL Navigator, PL/SQL Developer)
  - Named user licensing model is locked to a single or few client machines

15.04.2011 ©

### Conclusion

### - - -

- The Profiler and the VST alone makes DB Optimizer XE a valuable tool for every Oracle DB related, performance optimizing job
- The parsing and saving errors are considered bugs and we expect that they should be addressed in coming releases
- We recommend to start licensing negotiations with Embarcadero Technologies to enable every Trivadis Performance Consultant to use the tool as part of the APM survival kit
- Additional Technology projects for SQL Server is recommended too
